

Soc Internship Day16

Assignment

- 1 Explain UBA
- 2 Identify anomalies
- 3 Suggest risks

(1)

UBA (User Behavior Analytics) is a security technology that monitors and analyzes how users normally behave on a network and detects unusual activities that may indicate a threat.

How UBA Works

- Collects user activity logs from systems, applications, VPNs, email, and network devices.
- Creates a baseline of normal behavior for each user.
- Compares new activities against the baseline.
- Generates alerts when suspicious behavior is detected.

(2)

09:00 Login Success - user1 - 192.168.1.10

09:05 Access HR Portal - user1

09:10 Download HR Report - user1

02:15 Login Success - user1 - 185.45.23.11

02:16 Access Finance Server - user1

02:20 Download 5GB Data – user10

Anomaly	Reason
Login at 02:15 AM	User normally works during business hours.
New IP Address (185.45.23.11)	Different from the usual IP (192.168.1.10).
Access to Finance Server	User normally accesses only the HR portal.
Large Data Download (5 GB)	Unusual volume compared to normal HR report downloads.
Multiple Anomalies in a Short Time	Login → Sensitive Access → Large Download indicates suspicious behavior.

(3)

Risk	Description
Account Compromise	An attacker may have obtained the user's credentials and logged in as a legitimate user.
Unauthorized Access	Sensitive systems (e.g., Finance Server) are being accessed without a business need.
Data Exfiltration	The 5 GB download may indicate theft of confidential company data.
Insider Threat	A legitimate user could be intentionally accessing and removing sensitive information.
Financial Loss	Stolen financial records or intellectual property could result in monetary damage.
Compliance Violations	Exposure of sensitive data may lead to regulatory penalties and legal issues.
Lateral Movement	An attacker with access to one account may attempt to access additional systems.
Reputation Damage	A data breach can reduce customer trust and harm the organization's reputation.
