

Soc internship day 14

Assignment

1 Create a threat hunting hypothesis

2 Analyze logs for patterns

3 Write findings

Hypothesis Title

Suspicious Malware Download from a Malicious Website

Hypothesis Statement

A user may have downloaded malware from a malicious website through a web browser, leading to potential system compromise and unauthorized access.

Data Sources

- Web Proxy Logs
- DNS Logs
- Firewall Logs
- EDR/XDR Alerts
- Browser History
- SIEM Events

Indicators to Hunt For

1. Downloads from newly registered or suspicious domains.
2. Executable files (.exe, .msi, .bat, .scr) downloaded from the internet.
3. Browser processes spawning PowerShell or Command Prompt.
4. Antivirus or EDR detections shortly after a download.
5. Connections to known malicious IP addresses.
6. Unusual outbound network traffic after a file download.

User: employee01

Downloaded: update_tool.exe

Domain: fake-update-security.com

Time: 14:25:10

Process:

chrome.exe → update_tool.exe → powershell.exe

Investigation Steps

1. Identify the downloaded file.
2. Calculate the file hash and check reputation.

3. Analyze the source domain and IP address.
4. Review process execution after download.
5. Check for persistence mechanisms.
6. Investigate network connections made by the file.
7. Determine whether additional systems were affected.

Expected Findings

- Malware infection.
- Unauthorized software execution.
- Credential theft attempts.
- Command-and-Control (C2) communication.
- Lateral movement preparation
